

Exercise A

"BE SURE TO DRINK YOUR OVALTINE"

Exercise B

:)

Exercise C

1. Although the use of `let` allows for more dynamic typing, Swift primarily uses static typing.
2. This means that type checking is done in the static context - before runtime. Errors about invalid typing are thrown before the program ever executes.

Exercise D

The grammar can be also represented with the regular expression ro^*z^+
The grammar contains the strings 1, 3, and 5.

Exercise E

This language contains all strings that start with n many pairs of a 's (aa), where n is greater than or equal to 0, followed by zero or more c 's, and ended by n many pairs of b 's (bb).

Exercise F

The regular expression $x^*(ab|c)^*$ contains the strings labeled 1, 3, 4, 5, and 7.

Exercise G

This regular expression matches all strings that have any number of a 's, b 's, and c 's and also have one b , by matching the arbitrary set of $[abc]$ on either side of a singular b .

$(a|b|c)^*b(a|b|c)^*$

Exercise H

1. No, this grammar contains the rule $S \rightarrow SaS$ which is not one of the accepted forms of productions for a regular grammar. We have to track how many S 's are generated on both sides of the a .
2. Yes, this grammar is context-free as all of its productions' left sides contain a single non-terminal.

3. Leftmost:

S
 SaS
 baS
 bab

4. Rightmost:

S
 SaS
 Sab
 bab

5. The string *babab* has two different parse trees.

Parse tree one:

Parse tree two:

6.

$S \rightarrow bA$
 $A \rightarrow aS \mid \varepsilon$

This is non-ambiguous as all derivations generate right-most derivations.

Exercise E

1.

$xaa+$

2.

3.
$$\begin{array}{l} S \rightarrow xaaA \\ A \rightarrow a \mid \varepsilon \end{array}$$

4. No, the grammar is not ambiguous as any derivation will always contain the first step, followed by n many additional of the second steps for any number of a 's needed past two a 's. Since there are only two possible productions for A , and one of them is the empty string ε , there are no alternative ways to construct a string in the language from this grammar.

Exercise J

The provided statements are given (NOT IN BNF FORM!!!):

$\langle \text{uc-letter} \rangle ::= \text{A-Z}$
 $\langle \text{lc-letter} \rangle ::= \text{a-z}$

My solution is:

$$\begin{array}{l} \langle \text{name} \rangle ::= \langle \text{real-name} \rangle \langle \text{middle-name} \rangle \langle \text{real-name} \rangle \\ \langle \text{real-name} \rangle ::= \langle \text{uc-letter} \rangle \langle \text{lc-letter} \rangle \langle \text{lc-tail} \rangle \\ \langle \text{lc-tail} \rangle ::= \langle \text{lc-letter} \rangle \langle \text{lc-tail} \rangle \mid "" \\ \langle \text{middle-name} \rangle ::= " " \mid " " \langle \text{uc-letter} \rangle ". " \end{array}$$

Note: " " is a single space character and "" is the empty string.
