

## Exercise A

“BE SURE TO DRINK YOUR OVALTINE”

## Exercise B

:)

## Exercise C

1. Although the use of `let` allows for more dynamic typing, Swift primarily uses static typing.
2. This means that type checking is done in the static context – before runtime. Errors about invalid typing are thrown before the program ever executes.

## Exercise D

The grammar can be also represented with the regular expression  $r o * z +$

The grammar contains the strings 1, 3, and 5.

## Exercise E

This language contains all strings that start with  $n$  many pairs of  $a$ 's ( $aa$ ), where  $n$  is greater than or equal to 0, followed by zero or more  $c$ 's, and ended by  $n$  many pairs of  $b$ 's ( $bb$ ).

## Exercise F

The regular expression  $x * (ab | c) *$  contains the strings labeled 1, 3, 4, 5, and 7.

## Exercise G

This regular expression matches all strings that have any number of  $a$ 's,  $b$ 's, and  $c$ 's and also have one  $b$ , by matching the arbitrary set of  $[abc]$  on either side of a singular  $b$ .

$(a | b | c) * b (a | b | c) *$

## Exercise H

1. No, this grammar contains the rule  $S \rightarrow SaS$  which is not one of the accepted forms of productions for a regular grammar. We have to track how many  $S$ 's are generated on both sides of the  $a$ .
2. Yes, this grammar is context-free as all of its productions' left sides contain a single non-terminal.

3. Leftmost:

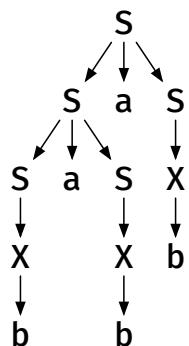

|       |
|-------|
| $S$   |
| $SaS$ |
| $baS$ |
| $bab$ |

4. Rightmost:

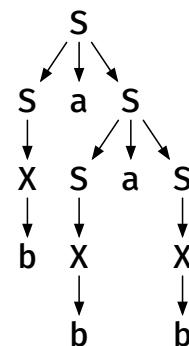

|       |
|-------|
| $S$   |
| $SaS$ |
| $Sab$ |
| $bab$ |

5. The string  $babab$  has two different parse trees.

Parse tree one:

Parse tree two:

6. 

|                                  |
|----------------------------------|
| $S \rightarrow bA$               |
| $A \rightarrow aS \mid \epsilon$ |

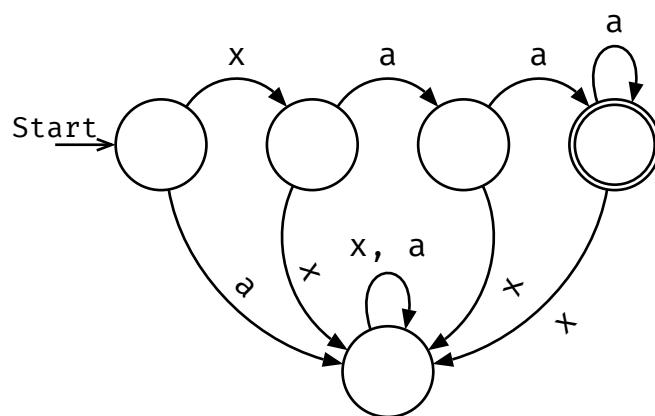

This is non-ambiguous as all derivations generate right-most derivations.

## Exercise E

1. 

|        |
|--------|
| $xa +$ |
|--------|

2.

3. 
$$\begin{array}{l} S \rightarrow xaaA \\ A \rightarrow a \mid \epsilon \end{array}$$

4. No, the grammar is not ambiguous as any derivation will always contain the first step, followed by  $n$  many additional of the second steps for any number of  $a$ 's needed past two  $a$ 's. Since there are only two possible productions for  $A$ , and one of them is the empty string  $\epsilon$ , there are no alternative ways to construct a string in the language from this grammar.

## Exercise J

The provided statements are given (NOT IN BNF FORM!!!):

$$\begin{array}{l} <\text{uc-letter}> ::= \text{A-Z} \\ <\text{lc-letter}> ::= \text{a-z} \end{array}$$

My solution is:

$$\begin{array}{l} <\text{name}> ::= <\text{real-name}> <\text{middle-name}> <\text{real-name}> \\ <\text{real-name}> ::= <\text{uc-letter}> <\text{lc-letter}> <\text{lc-tail}> \\ <\text{lc-tail}> ::= <\text{lc-letter}> <\text{lc-tail}> \mid "" \\ <\text{middle-name}> ::= " " \mid " " <\text{uc-letter}> ". " \end{array}$$

Note: " " is a single space character and "" is the empty string.
